

Regex [Regular Expressions]

* The Regex operator allows you to create complex string ~~patterns~~ patterns known as "Regular Expressions".

* The mask for a Regex phrase can contain special characters and constructs.

Examples:-

^ - Start with

\$ - End with

[] - specific character

| - or operation

" - Instance of character

'^.{Number}\$' - specific length of string

* MySQL supports ~~most~~ most of the symbols that are standard for creating regular expressions

* Both Like, Regex operators provide powerful functionality for finding information in a database

* that cannot be found any other way
